

## ***P2-Technologies Engagement Profile Industry: Consumer Packaged Goods***

**Client Business Problem:** Client's long-time application development and application hosting partner was terminating its business. Client venture funding and application integrity was seriously jeopardized as a result.

**The Solution:** P2-Technologies moved rapidly to establish a new hosting facility with a long-term business partner. All application code and third party applications were migrated in a rapid, yet deliberate fashion to the new host. Parallel processing was performed over a period of several days to ensure that data integrity had been preserved. DNS and domain name "switch" occurred with zero business disruption. Actual migration time for entire application environment: 10 days.

After the initial recovery effort, Client asked P2-technologies to rapidly familiarize ourselves with all custom code and business applications for the purpose of assuming responsibility for application development. This required rapid implementation of the following:

- Code review and functionality assimilation
- Business objective and measurement review
- Basic System Development Life Cycle discipline that allowed Client business management to submit, prioritize, and track application development issues
- Project tracking/defect tracking application that allowed for internet-based issue submission and work flow
- Quality Assurance environment and QA revision processes

### **Business value realized from this project recovery effort:**

- Un-interrupted business continuity
- Secured investment funding
- Solid development practices that allow client business applications to grow with the business

### **Tools Deployed in this Effort:**

- Issue/defect tracking system
- Corporate intranet
- Customized System Development Lifecycle Methodology
- Automated Test Harness
